

# STAT345: Homework 6

Jordan Medlock

November 09, 2014

## Problem 1

**a**

Mean of the exercise group: 287.9167

Mean of the no exercise group: 325.375

**b**

Standard deviation of exercise group: 106.0441

Standard deviation of no exercise group: 120.6754

**c**

Median of exercise group: 265.5

Median of no exercise group: 294

d

Histogram of exercise group:

Histogram of no exercise group:

e

Exercise group box plot:

No exercise group box plot:

**f**

The no exercise group has higher gene excitation because it has a higher mean and median.

## **Problem 2**

**a**

Mean of  $\bar{X}_1$  is 2

Variance of  $\bar{X}_1$  is 0.225

**b**

Mean of  $\bar{X}_2$  is 2

Variance of  $\bar{X}_2$  is 0.1125

**a**

Mean of xbar1 is 2.019538

The difference between the theoretical and actual values is 0.019538

**b**

Variance of xbar1 is 0.191268 The difference between the theoretical and actual values is 0.033732

**a**

Variance of xbar2 is 0.1146052 The difference between the theoretical and actual values is 0.0021052

**b**

There is a much smaller variance with the larger sample size because it comes closer and closer to approximating the perfect normal distribution.
